## Parametry:

```
train_episodes = 10
epsilon = 0.3
gamma = 0.99
max_steps = 200
```

Tworzymy **sieć docelową** (ang. target network):

```
target_model = tf.keras.models.clone_model(model)
```

Ustalamy jak często sieć ma być **synchronizowana**:

```
sync_freq = 30
```

Definiujemy **pamięć** jako kolejkę:

```
memory = deque(maxlen=100)
```

Ustalamy rozmiar **batch**:

```
batch_size = 10
```

Funkcja odpowiedzialna za **trenowanie modelu**:

```
def train():
  state_batch, Qs_target_batch = [], []

  minibatch = random.sample(memory, batch_size)

  for state, action, reward, next_state, done in minibatch:

    if done:
      y = reward
    else:
      #UWAGA!!!!
      #-----------------------------------------------
      #wyliczając max Q korzystamy z 'target network'
      y = reward + gamma*np.max(target_model.predict(next_state)[0])

    Q_target = model.predict(state)
    Q_target[0][action] = y

    state_batch.append(state)
    Qs_target_batch.append(Q_target)

  state_batch = np.array(state_batch).reshape(batch_size,4)
  Qs_target_batch = np.array(Qs_target_batch).reshape(batch_size,2)

  h = model.fit(state_batch,Qs_target_batch,epochs=1,verbose=0)

  loss = h.history['loss'][0]
```

```
  return loss
